Living Space

Sustaining the Earth and Ourselves Using Sunlight, Air and Water

Van Evera Bailey Design Studio
Arch 484/584 Spring Term 2008

Many of the indoor spaces where we spend long periods of time lack sufficient sensory stimulation to keep us fully alert and attentive. With the objective of helping to improve the well-being of both building occupants and the Planet, this studio will explore the visual animation of passive energy devices using the natural movement of external sunlight, air and water.

An initial project, introducing naturally generated movement into an existing space where people commonly spend long periods underoccupied, will be followed by the design of a model indoor space integrating passive energy and natural animation.
