Seeing is Believing
Bringing Energy and Rainwater Saving to Life

Many of the indoor environments where we spend much of our lives lack two important requirements for human well-being—nature and change. At the same time, passive energy and rainwater saving often go unnoticed by the public, one reason they remain underutilized. This project attempts to address both of these issues by reconfiguring passive energy and rainwater saving techniques to naturally animate interior spaces. The context for these explorations is the design of climate-specific house prototypes for Oregon's Pacific Coast, Willamette Valley and High Desert regions.
